EFFECT OF SURFACE TENSION ON TIME DEPENDENT GRAVITY WAVES 9-20

Abstract: An initial value investigation into the two-dimensional linearized surface wave problem, which takes into account surface (tension) due to an arbitrary periodic disturbance, is made in the paper. An asymptotic solution which describes the behaviour of wave formation at all time, instead of only in the limit, has been obtained by a rigorous mathematical treatment. The corresponding steady state solution has also been derived as a limit. Finally, the effect of surface tension on the transient development of surface waves has been examined in some detail.

OPTIMAL TOUR WITH MULTIPLE JOB FACILITIES AT EACH STATION 45-49

Abstract: A functional equation has been obtained to solve the travelling salesman problem when multiple job facilities exist at each station. A numerical example has also been given to illustrate the steps involved in the computation.
