ZUR p^V -SUMMIERUNG DURCH RIESZ-VERFAHREN 53-69

Abstract: Using the concept of p^V -summability it is possible to prove, for a certain class of summability methods, simultaneously various theorems which are true analogously for both ordinary and absolute summability. The main project of this paper is, to use this method in order to establish some Tauberian theorems for the Riesz means. As particular cases we get two results of Pati and Bhatt.
