SECONDARY FLOW OF AN ELASTICO-VISCOUS FLUID BETWEEN TWO CONCENTRIC
SHHERES ROTATIN ABOUT A FIXD DIAMETER

95-100

167-168

Abstract: The present paper deals with the secondary flow of Newtonian and non-Newtonain fluids induces by the rotations of the two spherical boundaries, about a fixed daimeter. The secondary flow has been studied in detail for the Oldroyd, Walters and Rivlin-Ericksen fluids with various values of the non-Newtonian parameter involved and for large number of values of relative roations of the two spheres.
