SASAKIAN MAINFOLD WITH C-BOCHNER CURVATURE TENSOR 131-137

**Abstract:** The object of the present paper is to study sasakian mainfolds satisfying the condition R(X, Y).B = 0, where B is the C-bochner curvature tensor and R(X, Y, ) is considered as a derivation of the tensor algebra at each point of the tangent space. Also sasakian mainfolds in which the divergence of the C-bochner curvature tensor vanishes studied.

More on Almost S-continuity

139-146

**Abstract:** The aim of the paper is to continue the study of almost s-continuous functions initiated recentely by noiri et al.[18]. We improve some of their result and present some new ones. The class of quasi-open sets is introduced.

ON BEST APPROXIMATION IN REAL NORMED LINEAR SPACES AND CHARACTERIZATIONS OF REFLEXIVITY AND STRICT CONVEXITY 147-158

**Abstract:** Some characterizations of best approximation element, of proximinal, semitchebychefian and tchebychefian linear subspaces in real normed spaces are given.

EVALUTION OF SOME CLASSES OF BINOMIAL IDENTITIES AND TWO NEW SETS OF POLYNOMIALS 156-190

Abstract: We prove two main theorems:

1. There exist polynomials  $Q_i(n,p)$  of degree p+1-i in n such that

$$\sum_{k=j}^{n} k^{p} \binom{k}{j} = \sum_{i=1}^{p+1} (-1)^{i-1} Q(n,p) \binom{n+1}{j+i},$$

with  $Q_i(n,p) = 0$  for i < 1 or for i > p + 1. They satisfy the recurrence  $Q_{i+1}(n,p) = Q_i(n,p) - Q_i(n-1,p)$ . Also  $Q_1(n,p) = n^p$  and  $Q_{p+1}(n,p+1) = p!$ .

Explicitly  $Q_i(n,p) = \sum_{r=0}^{i-1} (-1)^r {i-1 \choose r} (n-r)^p.$ 

2. There exist polynomials  $R_i(j, p)$  of degree p in j such that

$$\sum_{k=j}^{n} {k \choose j} = \sum_{i+1}^{p+1} R_i(j,p) {n+1 \choose j+i}, \text{ with } R_i(j,p) = 0 \text{ for } i < 1.$$

or i > p+1. The *R*'s satisfy the recurrence  $R_i(j, p+1) = jR_i(j, p) + (j+1)R_{i-1}(j+1, p)$ . Also  $R_1(j, p) = j^p$  and  $R_{p+1}(j+1) = (j+2)\cdots(j+p) = j!(j+p_j)$ 

Explicitly

$$R_{i}(j,p) = \sum_{s=j}^{i+j-1} (-1)^{i+j-s-1} {\binom{i+j}{s+1}} \sum_{k=j}^{s} k^{p} {\binom{k}{j}}$$

Numerous consequences of these expansions and their connections with the Stirling numbers are presented. Programs using the language C++ have been devised to compute tables of the Q and R polynomials efficiently.

Metric entropy and sufficiant families 191-204

**Abstract:** The aim of the present paper is to introduce the concept of sufficient families in the study of metric entropy  $h(\phi, \mathcal{N})$  of

an F-measure preserving transformation  $\phi$  reletive to a sub  $\sigma$ -algebra  $\mathcal{N}$  of an F-dynamical system  $\Phi = (X, M, m, \phi)$ , having finitely many atoms. result including the rokhlin inequality have been obtained. It is proved that if  $\mathcal{N}$  is a one- sided genrator for  $[\mathcal{L}]$  with respect to  $\phi$  then the entropy  $h(\Phi, [\mathcal{L}]) = 0$ . This result includes the corresponding classical result as a particular case.

A GENERALIZATION OF SOM AND MUKHERJEE'S FIXED POINT THEOREM 205-209

**Abstract:** In this paper a fixed point theorem which generalizes a main result of som and mukherjee [6] is obtained.

## Yi-Hai Ma

On a class of mixed monotone operators and a kind of two-point boundary value problem 211-220

**Abstract:** Fixed point theorems for an important class of mixed monotone operators are proved and an application to the two-point boundary value problems for second order impulsive diffrencial equation is given.

## S. M. Mazhar

Absolute summability factors for fourier series 221-229

**Abstract:** A theorem on absolute summability factors for fourier series is obtained. Our result generalize certain theorem due to dikshit and dubey and other.

# Hydromagnetic flow of a viscoelasic fluid in a parallel plate channel with stretching walls 231-247

Abstract: An analysis is made of the study flow of an incompressible viscoelastic and electrically conducting fluid in a parallel plate channel in the presence of a uniform transverse magnatic field. Both the channel walls are streched in their own plane with a velocity varying linearly with distance from a fixed point. Solution for the velocity disttribution is obtained by intergrating numerically the ordinary differential equation derived from the governing equations by suitable transformation. For small value of reynolds number R, the ordinary differential equation also admits of an analytical solution which shows close agreement with the numerical solution. It is found that for fixed R and M(M) being the magnetic parameter). The wall shear stress  $\tau_w$  decreases very slowly with increase in the viscoelastic parameter  $K_1$ . Further it turns out that  $\tau_w$  increases with increase in M for mixed R and  $K_1$ . A novel result of the present analysis is that the reverse flow arising out of the streamwise velocity changing sign in the transverse direction in the absence of magnetic field (M = 0)can be almost eliminated by the application of a strong magnetic field.

On a generalized variational inequality in hausdorff topological vector spaces 249-257

> Abstract: Recently singh et al. [6] have given a very beautifull generalization of a result of F.E. browder on the existance of solution of a variational inequality. Problem using pseudo-momotone mappings in the setting of a hausdorff topological vector space behera and panda [1,2] have also studied several genralization of browder's result by considering variational-like inequalities. The aim of this paper is to study one more genralization of a result of singh et al. Which includes some result of behera and panda and siddiqi et al.[5] as cases.

A COINCIDENCE THEOREM FOR MULTI-VALUED MAPS UNDER ISHIKAWA ITERATES 259-263

> **Abstract:** In this paper we obtain a common coincidence point theorem for a pair of multi-valued maps with respect to a single-valued map in a normed linear space satisfying a generalized contractive condition using Ishikawa type iteration procedure.

### D. Rath

Spaces of r-convex sequences and matrix transformations 265-280

**Abstract:** A representation theorem for elements of  $l_1$  in terms of *r*-convex sequences is obtained which is used to establish matrix characterization theorems generalizing earlier results of Hahn, Dawson. the sequences spaces  $M_r$ ,  $bv_p$  are defined, certain related matrix classes are characterized and the  $\alpha$ -duals,  $\beta$ -duals of certain sequences spaces are determind.

### B. E. Rhoades

Norms and spectra of generalized hausdorff matrices bounded om  $l^2$  and c

Abstract: It is shown that certain generalized Hausdorff matrices are bounded operators on  $l^2$ , and a formula is obtained for their  $l^2$ -norm. This paper extends some of the results of [11] to generalized Hausdorff matrices.

## Ian Tweddle\*

A PERTURBATION THEOREM FOR BARRELLED COUNTABLE ENLARGEMENTS 307-311

**Abstract:** A barrelled countable enlargement (BCE) is obtained when the dual of a barrelled space is extended by a countably infinite number of dimensions in such a way that barrelledness is preserved. here we consider how the extending vectors of a BCE may be perturbed to produce a new BCE.
