A NOTE AN RELATIVIZATION IN RESOLVABILITY AND
IRRESOLVABILITY 1-8

Abstract: This paper will discuss relativization of resolvability and irresolvability in topological spaces and consider the relation with filter base via open hereditarily irresolvable spaces.

K. Jha

GENERALIZED COMMON FIXED POINT THEOREM FOR (ϕ, ψ) -WEAK
CONTRACTION IN FUZZY METRIC SPACES 9-26

Abstract: The aim of the present paper is to establish a common fixed point theorem for (ϕ, ψ) -weak contractions to fuzzy metric spaces employing the idea of altering distances between points which generalizes and improves various well-known comparable results.

S. Chauhan and B. D. Pant

COMMON FIXED POINT THEOREMS IN FUZZY METRIC
SPACES 27-43

Abstract: In this paper, we prove common fixed point theorems for occasionally weakly compatible maps in fuzzy metric spaces.

An example is also given which demonstrates the validity of our main result. Our results improve and extend the result of Sedghi, Shobe and Aliouche [A common fixed point theorem for weakly compatible mappings in fuzzy metric space, Gen. Math. 18(3) (2010) 3–12 MR2735558].

SOME PROPERTIES OF A CERTAIN CLASS OF ANALYTIC
FUNCTIONS

45-54

Abstract: In this paper, authors introduce a new class $R(\beta, \alpha, n; \lambda)$ of Salagean-type analytic functions. We obtain extreme points of $R(\beta, \alpha, n; \lambda)$ and some sharp bounds for $Re \left\{ \frac{D_\lambda^n f(z)}{z} \right\}$ and $Re \left\{ \frac{D_\lambda^{n-1} f(z)}{z} \right\}$. Relevant connections of the results presented here with various known results are briefly indicated.

GROWTH RATES OF COMPOSITE ENTIRE AND MEROMORPHIC
FUNCTIONS

55-94

Abstract: In this paper we discuss the growth rates of composite entire and meromorphic functions improving some earlier results of Lahiri and Datta [9] and Datta [3].

LINKED AUTOMATA AS COMPONENTS OF A BIAUTOMATON

95-107

Abstract: We consider the relation between automata of left translations and automata of right translations on a semigroup S . The concept of linked automata describes this situation. We

introduce the concept of biautomaton to provide another way of describing the above situation. An automaton with two sets of input symbols is considered. This is closely related to linked automata and these relations are studied.

ON NEARLY FUZZY COMPACT SPACES WITH RESPECT TO
FUZZY IDEAL

109-116

Abstract: A fuzzy ideal on a set X is a nonempty collection of subsets of X with heredity property which is also closed under finite unions. The concept of nearly fuzzy compact spaces was introduced by Singal and Mathur [4]. In this paper, we introduce nearly fuzzy compact spaces with respect to fuzzy ideal and discuss some of their properties.

MAXIMUM MODULUS AND MAXIMUM TERM OF GENERALIZED
ITERATED ENTIRE FUNCTIONS

117-131

Abstract: We consider generalized iteration of entire functions and compare maximum modulus and maximum term of generalized iterated entire functions with that of the generating functions.
